SUMMARY

Senior Full-Stack Engineer, **5 years** shipping production SaaS end-to-end. Lead engineer at Rocket Devs on **Indieicator** (Stripe Connect revenue analytics, ~3 months) and **Sat-Raj** (NJ fuel distribution ops — replaced a daily **45–60 minute manual workflow** with software that finishes in **under 90 seconds**). Promoted Junior to Senior at Apify in 18 months while shipping **Diffed.gg** (3-sided gaming marketplace) end-to-end in **2 months** on a 3-person team. Stack: Next.js, Node.js, Express, PostgreSQL, Supabase, Redis, Stripe, AWS.

SKILLS

Languages	TypeScript, JavaScript, SQL
Frontend	Next.js (App Router), React, Tailwind, Shadcn, Framer Motion, responsive design
Backend	Node.js, Express, Prisma, REST API design, webhooks, Socket.IO, OAuth / JWT authentication
Data	PostgreSQL, Supabase (row-level security), Redis, MongoDB; schema + database design, migrations
Payments	Stripe, Stripe Connect, Paddle, multi-currency wallets, ECB FX (per-day historical rates)
Testing	Jest, Vitest, Playwright; unit + integration testing
Integrations	Samsara API, supplier FTP polling, QuickBooks (via on-prem bridge), webhook idempotency
Cloud / Infra	AWS (Lambda, S3, RDS, EC2), Cloudflare, Vercel, Docker, GitHub Actions, CI/CD; Sentry observability
AI / Process	Claude Code (daily loop), prompt engineering, agentic workflows, n8n; system design, code review, mentorship, cross-functional collaboration with founder clients

EXPERIENCE

Senior Full-Stack Engineer · Rocket Devs <i>Lead engineer on founder-client SaaS builds · US, EU, MENA</i>	Jul 2025 – Present Remote
- Lead engineer on two production SaaS builds shipped to live customers: a Stripe-powered revenue analytics platform (Indieicator) and an internal operations platform for a 30-year-old US fuel wholesaler (Sat-Raj). Owned the complete schema and architecture for both, from initial models through deployment. - Replaced a 30-year-old company's manual spreadsheet workflow. Daily pricing run — pricing calculation, customer emails, invoice generation — went from 45–60 minutes of manual work to under 90 seconds. - Managed 2 junior developers (UI tasks); direct cross-functional collaboration with founder clients on requirements and scope.	
Full-Stack Engineer · Design&Desktop <i>AI tooling + data platforms</i>	Jan 2025 – Jul 2025 Remote
- Rebuilt an AI video generator's rendering pipeline. Original FFmpeg.wasm approach took 2–10 minutes per render depending on the user's device. After multithreading FFmpeg.wasm got partial gains, migrated to mediabunny — ~90% reduction in render time (20-min renders to ~20 sec), consistent across browsers. - Two B2B platforms for the German market. Restaurant data-scraping pipeline ran ~80% faster after I converted single-instance Chromium to 5-way parallel batch scraping. B2B bulk-goods marketplace shipping engine solved Germany's multi-ZIP-per-city addressing by scraping and modeling ~12,000 ZIP codes with city/state relations into Supabase.	
Senior Engineer · Apify <i>Agency-style B2B SaaS builds for clients · Onsite (Karachi)</i>	Jul 2023 – Dec 2024
- Shipped Diffed.gg (3-sided gaming services marketplace — player, expert, admin) end-to-end in 2 months as senior on a 3-person team. Built a game-creation engine on the backend so admins onboard new games and their ranking systems (divisions vs. straight ranks like master/grandmaster) without writing code — same engine still runs in production. - Built the Stripe-funded multi-currency platform wallet on Diffed.gg with a currency service that settles every wallet transaction at the FX rate of the day it happened. Led 2 junior developers on Diffed.gg; designed the complete schema, architecture, and admin panel.	
Junior to Mid Engineer · Apify	Jan 2022 – Jun 2023
Promoted from Junior to Senior Engineer in 18 months (Jul 2023, while leading the Diffed.gg build). - Built features across multiple agency-client B2B SaaS products. Designed dashboards on the frontend; leveled up across the backend stack.	

SELECTED PROJECTS

Indieicator

indieicator.com

Baremetrics-style revenue analytics platform on Stripe Connect, built end-to-end for a founder client and shipped to production in ~3 months.

- Designed three parallel ingestion flows — live Stripe/Paddle webhooks, a 24-hour catch-up cron on GitHub Actions, and a 2-year initial backfill background job — feeding a multi-tenant Postgres ledger with row-level security via Supabase.
- Engineered a **hybrid invoice + event MRR ledger** that survives Stripe's 3-month event retention window and handles proration on mid-cycle plan changes.
- Per-day FX conversion via the European Central Bank API across 30 display currencies; Redis-cached dashboards; drill-down to source customer on every aggregated metric for trust + verification.

· Next.js · Node.js · Express · Prisma · Supabase (RLS) · Stripe Connect · Paddle · Redis · GitHub Actions · Cloudflare

Diffed.gg

diffed.gg

Three-sided gaming services marketplace (player, expert, admin). Shipped end-to-end in 2 months as senior engineer leading a 3-person team.

- Built a **game-creation engine** on the backend so admins onboard any new game and its ranking system (divisions vs. straight ranks like master/grandmaster) without writing code.
- Designed the Stripe + PayPal-funded multi-currency platform wallet plus a currency service that settles every wallet transaction at the FX rate of the day it happened.
- Socket.IO chat with order context; OAuth-based authentication; admin fee-split flows; screenshot verification for service completion; integer-cent accounting throughout.
- Designed the complete schema, architecture, and admin panel; mentored 2 junior developers on the build.

· Next.js · Node.js · Express · Prisma · PostgreSQL · Socket.IO · Stripe · PayPal · TypeScript

Sat-Raj

satraj.inc

End-to-end internal ops platform for a 30-year-old NJ fuel wholesaler. Replaced 39 hand-edited Google Sheets. Daily pricing run: 45–60 min → under 90 sec.

- Pricing engine emails daily prices with per-customer margins (ops sets margins in a dedicated UI; applied on the fly when emails generate).
- Invoice engine reconciles Samsara truck telematics against the supplier FTP server via **idempotent 3-hour background jobs** — safely re-runnable, no double-counting.
- **3-gate address mapping** replaced free-text driver addresses with: dispatch dropdowns → pre-filled driver forms → Samsara geofence fallback (lat/long → customer location).
- Custom **.NET bridge** on the ops team's Windows machine polls our API every 3 hours and pushes new invoices into on-prem QuickBooks.

· Next.js · Node.js · Express · PostgreSQL · Samsara API · AWS · QuickBooks

EDUCATION

BS, Artificial Intelligence · SZABIST University Islamabad

Nov 2018 – May 2022
