

Uzair Saleem

Senior Full-Stack Engineer

Islamabad, Pakistan · +92 310 5187872 · uzairsaleemdev@gmail.com · uzairsaleem.dev · [github/developeruzairsaleem](https://github.com/developeruzairsaleem) · [LinkedIn](#)

SUMMARY

Senior Full-Stack Engineer with 5 years building production SaaS platforms end-to-end across fintech, analytics, marketplaces, and operations software. Experienced leading architecture, backend systems, and cross-functional delivery for founder-led startups. Strong focus on Next.js, Node.js, PostgreSQL, Stripe, and scalable product infrastructure.

SKILLS

Languages	TypeScript, JavaScript, SQL
Frontend	Next.js (App Router), React, Tailwind CSS, Shadcn UI, Framer Motion, responsive design
Backend	Node.js, Express.js, Prisma, REST APIs, webhooks, Socket.IO, OAuth, JWT authentication
Databases & Data	PostgreSQL, Supabase (row-level security), Redis, MongoDB; database design, schema design, migrations
Payments & Integrations	Stripe, Stripe Connect, Paddle, PayPal, multi-currency systems, ECB FX, Samsara API, QuickBooks integrations
Cloud & Infrastructure	AWS (EC2, RDS, S3, Lambda), Cloudflare, Vercel, Docker, GitHub Actions, CI/CD, Sentry
Testing	Jest, Vitest, Playwright; unit and integration testing
AI / Process	Claude Code (daily loop), prompt engineering, agentic workflows, n8n; system design, code review, mentorship, cross-functional collaboration with founder clients

EXPERIENCE

Senior Full-Stack Engineer · Rocket Devs Jul 2025 – Present

Lead engineer on founder-client SaaS builds · US, EU, MENA Remote

- Lead engineer on **two production SaaS platforms**: Indiecarator (Stripe revenue analytics) and Sat-Raj (fuel distribution operations platform).
- Replaced a manual pricing and invoicing workflow at a 30-year-old fuel wholesaler, reducing the daily run from **45–60 minutes to under 90 seconds**.
- Designed and shipped backend architecture, schemas, APIs, and deployment infrastructure across both platforms.
- Led **2 junior developers** and worked directly with founder clients on product scope, requirements, and delivery.

Full-Stack Engineer · Design&Desktop Jan 2025 – Jul 2025

AI tooling + data platforms Remote

- Rebuilt an AI video generator's rendering pipeline. Original FFmpeg.wasm approach took 2–10 minutes per render depending on the user's device. After multithreading FFmpeg.wasm got partial gains, migrated to **mediabunny** — **~90% reduction in render time** (20-min renders to ~20 sec), consistent across browsers.
- Two B2B platforms for the German market. Restaurant data-scraping pipeline ran **~80% faster** after I converted single-instance Chromium to 5-way parallel batch scraping. B2B bulk-goods marketplace shipping engine solved Germany's multi-ZIP-per-city addressing by scraping and modeling **~12,000 ZIP codes** with city/state relations into Supabase.

Senior Engineer · Apifiny Jul 2023 – Dec 2024

Agency-style B2B SaaS builds for clients · Onsite (Karachi)

- Shipped **Diffed.gg**, a 3-sided gaming services marketplace (player, expert, admin), **end-to-end in 2 months** as senior engineer on a 3-person team.
- Built a configurable **game-creation engine** so admins onboard new games and their ranking systems (divisions vs. straight ranks like master/grandmaster) without writing code — same engine still runs in production.
- Designed the multi-currency platform wallet and settlement system using Stripe and PayPal integrations; every wallet transaction settles at the FX rate of the day it happened.
- Led architecture, backend systems, and admin tooling; **mentored 2 junior developers** on the build.

Junior to Mid Engineer · Apifiny Jan 2022 – Jun 2023

- Promoted from Junior to Senior Engineer in 18 months** based on technical ownership and delivery impact.
- Built and shipped features across multiple B2B SaaS products for agency clients. Worked across frontend dashboards, backend APIs, and database systems while expanding into full-stack architecture responsibilities.

SELECTED PROJECTS

Indieicator

indieicator.com

Revenue analytics platform on Stripe Connect for subscription businesses; shipped to production in ~3 months.

- Designed multi-tenant ingestion combining live Stripe/Paddle webhooks, scheduled reconciliation jobs on GitHub Actions, and a 2-year historical backfill pipeline.
- Built a **hybrid invoice + event MRR ledger** that survives Stripe's 3-month event retention window and handles proration on mid-cycle plan changes.
- Implemented per-day FX conversion across 30 display currencies using ECB exchange-rate data.
- Developed Redis-cached analytics dashboards with drill-down to source customer transactions on every metric.

Diffed.gg

diffed.gg

Gaming services marketplace supporting players, experts, and administrators. Shipped end-to-end in 2 months as senior engineer on a 3-person team.

- Built a configurable **game-creation engine** for onboarding new games and ranking systems (divisions vs. straight ranks like master/grandmaster) without code changes.
- Designed a multi-currency wallet and settlement system supporting Stripe and PayPal funding flows; transactions settle at the FX rate of the day they happened.
- Implemented real-time order chat, OAuth-based authentication, admin fee-splitting, and service-completion verification workflows.
- Led system architecture, schema design, backend infrastructure, and admin tooling; mentored 2 junior developers.

Sat-Raj

satraj.inc

Operations platform for a 30-year-old US fuel wholesaler, replacing 39 manually managed spreadsheets. Daily pricing run: 45–60 min → under 90 sec.

- Automated pricing calculations, invoice generation, and customer communication workflows; ops team sets per-customer margins in a dedicated UI applied on the fly.
- Built reconciliation pipelines integrating Samsara telematics with supplier FTP systems through **idempotent 3-hour background jobs** — safely re-runnable, no double-counting.
- **3-gate address mapping** replaced inconsistent free-text driver entries: dispatch dropdowns → pre-filled driver forms → Samsara geofence fallback (lat/long → customer location).
- Integrated on-prem QuickBooks through a custom **.NET bridge** on the ops team's Windows machine that polls our API every 3 hours and pushes invoices into local QuickBooks.
