

Uzair Saleem

Senior Full-Stack Engineer

Islamabad, Pakistan · uzairsaleemdev@gmail.com · uzairsaleem.dev · [github/developeruzairsaleem](https://github.com/developeruzairsaleem) · [LinkedIn](#)

SUMMARY

Senior Full-Stack Engineer with **4+ years** shipping production B2B SaaS products end-to-end for founders in the US and Germany. Six live products shipped solo on contract, including a Baremetrics-style revenue analytics platform, a two-sided marketplace, and a fuel distribution platform that replaced 30 years of spreadsheet workflow. I own architecture, backend, frontend, and infra — and I hold a high bar for correctness: integer-cent money handling, idempotent webhooks, parity-first migrations, and tests pinned to legacy state. Looking for senior full-stack roles at product-focused companies. Remote, any reasonable timezone overlap.

CORE SKILLS

Languages	TypeScript, JavaScript, SQL, Python (basics)
Frontend	Next.js 15/16 (App Router), React 19, Tailwind CSS, Framer Motion, Recharts, Ant Design
Backend	Node.js, Express, Prisma, REST APIs, Server Actions, Socket.IO
Data	PostgreSQL, Supabase, AWS RDS, schema design, migrations
Auth	NextAuth v5, JWT, bcrypt, RBAC, OAuth integrations
Payments	Stripe Connect, PayPal, webhook handling, idempotency, integer-cent accounting
Infra / Cloud	AWS (Amplify, RDS, S3, SES, Secrets Manager), Vercel, CloudFront
Integrations	Stripe / Paddle / LemonSqueezy / Shopify, Samsara API, DTN feed, QuickBooks, UploadThing
Practices	Parity-first migration, human-in-the-loop on ambiguous data, DB-driven config, AI-assisted dev workflow

EXPERIENCE

Senior Full-Stack Engineer · Sat-Raj, Inc. (Contract)

Jan 2026 – Apr 2026

Built fuel distribution platform end-to-end

Voorhees, NJ · Remote

- Replaced **30 years of 39-tab Google Sheets workflow** with a multi-tenant Next.js platform: pricing engine, BOL ingestion pipeline, and invoice generator. Sole engineer.
- Cut daily price-distribution run from **45–60 minutes of manual work to under 90 seconds**, with full audit history and zero per-customer formula drift.
- Built DTN supplier ingestion (parses daily terminal price feeds), Samsara API integration (BOLs into a unified review queue), and QuickBooks invoice push.
- Designed multi-state tax + per-location freight model that produced byte-identical prices to the legacy sheet on the parity test day.
- Architecture: Next.js 16 App Router (RSC for read-only views, API routes for mutations), Prisma 6 + PostgreSQL on AWS RDS, NextAuth v5 with RBAC, transactional email via AWS SES with verified DKIM, hosting on AWS Amplify + CloudFront.
- Configuration kept in the database (tax rules, margins, suppliers) so operations updates require no deploy.

Senior Full-Stack Engineer · Indiecator (Contract)

2025

Built Baremetrics-style revenue analytics platform end-to-end

Founder-led indie SaaS · Remote

- Sole engineer on a self-serve revenue analytics platform: connect Stripe via OAuth, get full historical reconstruction in minutes.
- Designed the data model around a single insight — **store movements, not MRR**. Every subscription change recorded as an immutable `MrrMovement` (NEW / EXPANSION / CONTRACTION / CHURN / REACTIVATION) with signed dollar impact.
- Three reconciling sync paths (backfill, real-time webhooks, daily reconciliation cron) all using the same primitives — webhook outages heal within 24 hours.
- Solved the hard cases: trial conversion semantics, proration filtering, churn-without-inventing-revenue (queries last positive movement), webhook idempotency with per-type dedup windows, weighted churn across portfolio integrations.
- 15+ Prisma models · 840-line schema · 65 backend files · 149 frontend files · full Baremetrics-style metric suite (MRR, ARR, churn, ARPU, LTV, cashflow, fees).
- Stack: Node.js + Express, PostgreSQL + Prisma, Next.js 16 + React 19 + TypeScript + Recharts, Supabase Auth, Stripe Connect.

Full-Stack Engineer · Diffed.gg (Contract)

2025

Built two-sided gaming services marketplace end-to-end

Founder-led marketplace · Remote

- Sole engineer on a marketplace handling the full transaction lifecycle: discovery, checkout, team formation, real-time chat, proof-of-completion, verification, and payouts.
- Stripe + PayPal checkout, both server-side validated against the configured price (never trust the client). Real-time chat over Socket.IO; provider queue uses polling for backpressure reasons.
- Money handled as **integer cents end-to-end** — earnings and payouts modeled as immutable transaction rows; balances always derivable. No float drift on multi-provider order splits.
- Built customer, provider, and admin flows in one product with clean role-gated layouts. Email-based admin invite flow with one-time tokens and registration handoff.
- Stack: Next.js 15 + React 19, Prisma + PostgreSQL, Socket.IO, Stripe + PayPal, NextAuth/JWT, UploadThing, Vercel Blob, Nodemailer.

Independent Full-Stack Developer (Contract)

2022 – 2024

Built SaaS, internal tools, and dashboards for international clients

US, Germany · Remote

- 10+ shipped client projects across SaaS, internal ops tools, real-time dashboards, and integrations. Modern Next.js + TypeScript + Postgres + Stripe stack throughout.
- Delivered end-to-end: gathered requirements direct with founders, scoped tightly, shipped weekly, owned deployments.
- Notable: data dashboard for a Germany-based SaaS with batch processing and role-based access; multiple Stripe-integrated SaaS MVPs for US indie founders.

SELECTED WRITING

Don't store MRR. Store movements. — Why I rebuilt Indiecator's data model around movements, not snapshots.

Floats killed the marketplace. I banished them. — Why every money calculation in Diffed.gg is integer cents end-to-end.

How we replaced 30 years of Google Sheets in 90 days — The parity-first, human-in-the-loop approach behind the Sat-Raj migration.
